

PadelLens — Talk Cheat Sheet *"You don't have to feel your game — you can see it."*

OPENING HOOK

"Padel = fastest-growing racket sport in Europe (1.1M in Italy). Pros have analytics; amateurs have nothing. PadelLens turns gut-feelings into numbers."

THE 6-BEAT FLOW (≥30 MIN)

- 1 Brief** — problem, Marco, angle, core message
- 2 Data** — 2 layers, sources, EDA findings
- 3 UX** — 5 pages, wireframes, 2 Nielsen fixes
- 4 Charts** — 9 charts justified, colour, interactivity
- 5 Tech** — Python/Streamlit web app (brief)
- 6 Demo + Future** — walk 5 screens, then next steps

NUMBERS (MEMORISE)

30 / 276 / 12 pro players / matches / tournaments
40 personal matches (~4 mo, 6 partners)
~55% (**22–18**) overall win rate
Luca 80% vs Davide 20% (60-pt partner spread)
2-set 80% vs 3-set 40% (~40pp fatigue fade)
Bandeja +176 / Smash -170 (weapon / weakness)
~68% pro straight-set rate · **9** charts · **3/3/3/2** relevance

AUDIENCE

Marco club player, logs in 90s · **Luca** amateur coach

ANGLE · FRAMING · FOCUS

Angle: reflective self-analysis (temporal/categorical/comparative)
Framing: loggable-in-90s IN; biometrics/heatmaps/scouting OUT
Focus: one headline number (last-10 win rate) + 1 plain insight

DATA — DEFEND IT

Layer A Pro (REAL): Padel API + committed CSV fallback for demo
Layer B Personal (SYNTHETIC SEED): no public amateur dataset exists — the absence IS the story; schema is real so live data drops in.

NIELSEN FIXES (WHAT THEY WANT)

- #5 Error prevention:** Set 3 locked until sets split 1–1
- #6 Recognition:** filters always-visible, not behind a button

COLOUR & ACCESSIBILITY

Blue=neutral · **Red=negative (+ always signed)** · Grey=pro ref · No green (colour-blind) · works in B/W · WCAG AA text

CHARTS — 1-LINE JUSTIFIES

Diverging Shot DNA: question is SIGNED → zero-line centre (beats pie)
Radar (Compare): small fixed parallel set + numeric panel beside it
Rolling line: 5-match mean kills single-match noise
Rejected: pie, court heatmap, Sankey, 3D — style over substance

5 SCREENS (DEMO ORDER)

Home — last-10 win rate + partner bars + Shot DNA + drill
Pro Tour — real data, filters, ranking table + form sparklines
My Stats — 4 KPIs + 2×2 grid (rolling, partner, DNA, ~40pp fatigue)
Log Match — 90s form, Set-3 gating, live auto-result
Compare — radar you vs pro + worst-first gap/drill cards

TOP DEFENSES (RAPID)

Synthetic data? no public set; realistic + real schema.
Radar bad? fine for small fixed set; backed by numbers.
40 too few? seed data; rolling mean; directional not proof.
Why Streamlit? dataviz project; charts in pure Python; browser = cross-platform.
